PROGRAM STUDI TEKNIK INFORMATIKA INSTITUT TEKNOLOGI BANDUNG 2024

I. Persoalan Masalah

Persoalan masalah diambil dari spesifikasi tucil.

Cyberpunk 2077 Breach Protocol adalah minigame meretas pada permainan video Cyberpunk 2077. Minigame ini merupakan simulasi peretasan jaringan local dari ICE (Intrusion Countermeasures Electronics) pada permainan Cyberpunk 2077. Komponen pada permainan ini antara lain adalah:

- 1. Token: terdiri dari dua karakter alfanumerik seperti E9, BD, dan 55.
- 2. Matriks: terdiri atas token-token yang akan dipilih untuk menyusun urutan kode.
- 3. Sekuens: sebuah rangkaian token (dua atau lebih) yang harus dicocokkan.
- 4. Buffer: jumlah maksimal token yang dapat disusun secara sekuensial.

Aturan permainan Breach Protocol antara lain:

- 1. Pemain bergerak dengan pola horizontal, vertikal, horizontal, vertikal (bergantian) hingga semua sekuens berhasil dicocokkan atau buffer penuh.
- 2. Pemain memulai dengan memilih satu token pada posisi baris paling atas dari matriks.
- 3. Sekuens dicocokkan pada token-token yang berada di buffer.
- 4. Satu token pada buffer dapat digunakan pada lebih dari satu sekuens.
- 5. Setiap sekuens memiliki bobot hadiah atau reward yang variatif.
- 6. Sekuens memiliki panjang minimal berupa dua token.

Akan dibuat sebuah program untuk menemukan solusi dari permainan Breach Protocol yang paling optimal untuk setiap kombinasi matriks, sekuens, dan ukuran buffer dengan menggunakan algoritma brute force.

II. Penjelasan Kode Program

Persoalan masalah diselesaikan dengan menggunakan bahasa JavaScript dan memanfaatkan HTML (serta Tailwind) sebagai GUI.

Disclaimer 1: Sebelumnya, saya merasa yakin bahwa ada algoritma yang lebih optimal dan lebih baik dan masih termasuk dalam jenis algoritma brute force, tetapi saya untuk sekarang mengusahakan program bekerja terlebih dahulu.

Disclaimer 2: Tidak semua code saya masukkan di Bab Penjelasan Kode Program. Untuk keseluruhan code dapat dilihat di repository maupun Bab Program Secara Lengkap.

1. Input

Input dibagi menjadi 2 jenis input, yaitu input dari file txt dan input dari CLI dengan memasukkan jumlah token unik, token, ukuran buffer, ukuran matriks (panjang dan lebar), jumlah sekuens, dan ukuran maksimal sekuens.

Untuk input dari file, user akan memasukkan nama file dan kemudian akan dicek oleh program, jika ada akan diekstrak ukuran buffer, ukuran matrix, matrix, ukuran sequence, dan sequencesnya. Asumsi ukuran matrix dan ukuran sequence valid untuk memudahkan pembacaan file, akan divalidasi ukuran tiap sequencenya (harus lebih dari sama dengan 2).

```
// Memproses file
async function loadTextFile() {
```

```
document.getElementById("invalidContainer").classList.add("hidde
n");
                                                filetxt
document.getElementById("fileInput").value.trim();
   const response = await fetch(filetxt);
   const lines = fileContent.trim().split('\n');
   const bufferSize = parseInt(lines[line num++]);
lines[line num++].split(' ').map(Number);
   const matrix = new Array(matrixHeight);
       matrix[i] = new Array(matrixWidth);
       const elements = lines[line_num++].trim().split(' ');
           matrix[i][j] = elements[j];
   const numberOfSequence = parseInt(lines[line num++]);
```

```
const sequence = lines[line num++].trim().split(' ');
parseInt(lines[line num++].trim());
        sequences.push({ sequence, sequenceReward });
   console.log("Buffer Size:", bufferSize);
   console.log("Matrix Width:", matrixWidth);
   console.log("Matrix Height:", matrixHeight);
   console.log(matrix);
   console.log(numberOfSequence);
   console.log(sequences);
   if (isSequenceLengthValid(sequences)) {
          processSequence (bufferSize, matrixHeight, matrixWidth,
matrix, tokens, sequences);
document.getElementById("invalidContainer").classList.remove("hi
```

Sedangkan untuk input dari user, akan diminta (terdapat GUI) ukuran buffer, jumlah token unik, token, lebar matrix, tinggi matrix, jumlah sequence, dan ukuran maksimal sequence. Asumsi ukuran matrix dan ukuran sequence valid, dilakukan validasi untuk memastikan jumlah token sesuai.

```
numberOfTokens
parseInt(document.getElementById("numberOfTokens").value);
document.getElementById("tokens").value.trim().split(" ");
                                           matrixWidth
parseInt(document.getElementById("matrixWidth").value);
                                          matrixHeight
parseInt(document.getElementById("matrixHeight").value);
                                         sequenceAmount
parseInt(document.getElementById("sequenceAmount").value);
                                  maximumSequenceContent
parseInt(document.getElementById("maximumSequenceContent").value
);
    const matrix = new Array(matrixHeight);
    for (let i = 0; i < matrixHeight; i++) {</pre>
        matrix[i] = new Array(matrixWidth);
    for (let i = 0; i < matrixHeight; i++) {</pre>
        for (let j = 0; j < matrixWidth; j++) {</pre>
                       tokenIndex = Math.floor(Math.random()
numberOfTokens);
            matrix[i][j] = tokens[tokenIndex];
    const sequences = [];
    for (let i = 0; i < sequenceAmount; i++) {</pre>
             const sequenceContent = Math.floor(Math.random()
(maximumSequenceContent - 2 + 1)) + 2;;
                       tokenIndex = Math.floor(Math.random()
numberOfTokens);
            sequence.push (tokens[tokenIndex]);
        const sequenceReward = Math.floor(Math.random() * 100)
        sequences.push({ sequence, sequenceReward });
```

```
console.log("Buffer Size:", bufferSize);
  console.log("Number of Tokens", numberOfTokens);
  console.log("Matrix Width:", matrixWidth);
  console.log("Matrix Height:", matrixHeight);
  console.log("Tokens:", tokens);
  console.log("Matrix: ", matrix);
  console.log("Sequences: ", sequences);

  if (numberOfTokensValid(tokens, numberOfTokensValid)) {
      processSequence(bufferSize, matrixHeight, matrixWidth,
matrix, tokens, sequences);
  } else {

  document.getElementById("invalidContainer").classList.remove("hidden");
  }
}
```

2. Inisiasi variable

Sebelum dimulai pengecekan, akan dibuat beberapa variable untuk memenuhi spesifikasi dari program yang meliputi sebuah matrix berukuran sama dengan matrix yang akan diolah tetapi berisi 0 untuk menandai koordinat mana saja yang sudah dicek mengingat masing-masing sel hanya boleh dicek sekali, array berukuran sama dengan banyak sequence dengan tujuan serupa, inisiasi 2 array kosong (global) untuk menyimpan sequence yang sudah diolah dan koordinatnya, serta 2 buah integer (global) untuk menyimpan reward terbaik dan untuk menyimpan berapa lama diproses. Di saat yang sama, ditampilkan semua variable yang sudah diekstrak sebelumnya.

```
// Variable global maximum
let maxSequence = [];
let maxCoords = [];
let maxReward = 0;
let elapsedTime = 0;
```

```
// Saatnya mengproses
function processSequence(bufferSize, matrixHeight, matrixWidth,
matrix, tokens, sequences) {

document.getElementById("invalidContainer").classList.add("hidde
n");
```

```
document.getElementById("debugContainer").classList.remove("hidd
en");
   maxSequence = [];
   maxReward = 0;
   elapsedTime = 0;
           document.getElementById("buffer-size").textContent
bufferSize;
               document.getElementById("matrix").textContent
JSON.stringify(matrix);
             document.getElementById("sequences").textContent
JSON.stringify(sequences);
   const startTime = performance.now();
   let sequenceVisited = new Array(sequences.length);
    for (let i = 0; i < sequences.length; i++) {</pre>
        sequenceVisited[i] = 0;
   let matrixVisited = [];
    for (let i = 0; i < matrixHeight; i++) {</pre>
        row.push(0)
        matrixVisited.push(row)
    let coordSequence = [];
    let savedSequence = [];
```

```
startCheckSequence(matrix, sequences, matrixWidth, matrixHeight, sequenceVisited, matrixVisited, coordSequence, savedSequence, bufferSize)
...
```

3. Algoritma (1)

Program yang dibuat akan mencari solusi optimal (reward terbesar) dari permasalahan yang terdapat pada Bab Persoalan Masalah. Solusi akan dicari dengan menggunakan algoritma Brute Force, yang berarti mencari semua kemungkinan yang ada tanpa terlalu memikirkan optimasi program.

Berdasarkan spesifikasi, solusi akan dimulai dari baris pertama matrix, lalu horizontal, vertikal, dan selang-seling selanjutnya. Karena pengecekan secara brute force mencari semua kemungkinan, algoritma program diawali dengan untuk iterasi tiap sequence yang ada, dilakukan iterasi tiap elemen pada baris pertama untuk pengecekan secara kolom.

4. Algoritma (2)

Setiap kolom pada matriks kemudian akan dicek satu per satu elemennya. Di saat yang sama akan dilakukan tracking pada index keberapa sequence tersebut dicek. Untuk setiap elemen yang sama dengan sequence index kesekian, akan dilakukan pengecekan satu per satu secara baris. Selanjutnya akan dilakukan pemanggilan fungsi secara selang-seling antara kolom dan baris hingga sequence selesai atau tidak ditemukan elemen yang sama.

```
// Fungsi untuk iterasi dalam satu kolom
function cekSatuKolom(matrix, col, index, matrixVisited,
matrixWidth, matrixHeight, sequences, sequence, sequenceVisited,
currReward, coordSequence, savedSequence, bufferSize) {
    // Cek apakah sequence sudah berakhir belum dan cek apakah
buffer sudah penuh
```

```
if ((!check(index, sequence)) && (savedSequence.length <</pre>
bufferSize)) {
       for (let i = 0; i < matrixHeight; i++) {</pre>
                    if ((matrix[i][col] == sequence[index]) &&
(matrixVisited[i][col] != 1)) {
koordinat di baris pertama
                  console.log("Baris", i+1, "kolom", col+1, "=",
matrix[i][col]);
                let coordSequence copy = [...coordSequence];
                let savedSequence copy = [...savedSequence];
                                      let matrixVisited copy
JSON.parse(JSON.stringify(matrixVisited));
ditemukan di row pertama
                if (i == 0 && savedSequence.length == 0) {
                       coordSequence copy.push([col+1, i+1]); //
                    savedSequence copy.push(matrix[i][col]);
                    matrixVisited copy[i][col] = 1;
                              cekSatuKolom(matrix, col, index+1,
matrixVisited copy, matrixWidth, matrixHeight,
                                                      sequences,
                              currReward, coordSequence copy,
sequence,
           sequenceVisited,
savedSequence copy, bufferSize);
ditemukan di row pertama
                 } else if (i != 0 && savedSequence.length == 0)
                         coordSequence copy.push([col+1, 1]); //
                    savedSequence copy.push(matrix[0][col]);
                    matrixVisited copy[0][col] = 1;
```

```
coordSequence copy.push([col+1, i+1]); //
                   savedSequence copy.push(matrix[i][col]);
                   matrixVisited copy[i][col] = 1;
                              cekSatuBaris(matrix, i, index+1,
matrixVisited copy, matrixWidth, matrixHeight, sequences,
sequence, sequenceVisited, currReward, coordSequence copy,
savedSequence_copy, bufferSize);
                      coordSequence copy.push([col+1, i+1]); //
                   savedSequence copy.push(matrix[i][col]);
                   matrixVisited copy[i][col] = 1;
                               cekSatuBaris(matrix, i, index+1,
matrixVisited copy, matrixWidth, matrixHeight, sequences,
sequence, sequenceVisited,
                             currReward, coordSequence copy,
savedSequence copy, bufferSize);
       console.log()
       console.log("-- SELESAI! -- ");
       currReward = countReward(savedSequence, sequences);
       console.log("Current reward:", currReward);
       console.log("All coords:", coordSequence);
       console.log("All tokens saved:", savedSequence);
       console.log()
              let currSequenceIndex = sequenceIndex(sequence,
sequences);
       let sequenceVisited copy = [...sequenceVisited];
       sequenceVisited copy[currSequenceIndex] = 1;
```

```
continueCheckSequence(matrix, matrixVisited,
matrixWidth,
              matrixHeight,
                             sequences, sequenceVisited copy,
              coordSequence,
                              savedSequence, "kolom",
                                                           col,
currReward,
bufferSize);
function cekSatuBaris (matrix, row, index, matrixVisited,
matrixWidth, matrixHeight, sequences, sequence, sequenceVisited,
currReward, coordSequence, savedSequence, bufferSize) {
      if ((!check(index, sequence)) && (savedSequence.length <</pre>
bufferSize)) {
       for (let i = 0; i < matrixWidth; i++) {</pre>
                    if ((matrix[row][i] == sequence[index]) &&
(matrixVisited[row][i] != 1)) {
matrix[row][i]);
               let coordSequence copy = [...coordSequence];
                 coordSequence copy.push([i+1, row+1]); // Ingat
               let savedSequence copy = [...savedSequence];
               savedSequence_copy.push(matrix[row][i]);
                                      let matrixVisited copy
JSON.parse(JSON.stringify(matrixVisited));
               matrixVisited copy[row][i] = 1;
                              cekSatuKolom(matrix, i, index+1,
matrixVisited copy,
                     matrixWidth, matrixHeight,
                                                      sequences,
           sequenceVisited,
                              currReward, coordSequence copy,
sequence,
savedSequence copy, bufferSize)
```

```
console.log()
       console.log("-- SELESAI! -- ");
       currReward = countReward(savedSequence, sequences);
       console.log("Current reward:", currReward);
       console.log("All coords:", coordSequence);
       console.log("All tokens saved:", savedSequence);
       console.log()
               let currSequenceIndex = sequenceIndex(sequence,
sequences);
       let sequenceVisited copy = [...sequenceVisited];
       sequenceVisited copy[currSequenceIndex] = 1;
                   continueCheckSequence (matrix, matrixVisited,
matrixWidth,
              matrixHeight,
                             sequences,
                                            sequenceVisited copy,
              coordSequence, savedSequence,
                                                  "baris",
currReward,
                                                             row,
bufferSize);
```

Khusus untuk kolom, akan dicek untuk 3 kasus, yaitu jika elemen pertama solusi yang ditemukan dalam sequence ada pada baris pertama (karena kalau ada pada baris pertama maka dilakukan searching secara kolom), tidak ada pada baris pertama, dan pengecekan bukan untuk elemen pertama solusi.

Setelah menyelesaikan sebuah sequence, akan dihitung rewardnya (mengecek sequence apa saja yang terdapat dalam solusi) kemudian akan diupdate jika reward lebih besar atau reward sama tetapi panjang solusi lebih pendek.

}

5. Algoritma (3)

Jika satu sequence telah selesai, akan dilakukan pengecekan untuk sequence lainnya. Terdapat 2 kemungkinan, antara sequence yang dicek sudah ada pada sequence yang sudah menjadi solusi (subset) atau belum. Jika merupakan subset, akan dihitung kembali reward dan dicek maksimumnya. Jika bukan, akan dilanjutkan untuk baris atau kolom.

```
function
            continueCheckSequence
                                                   matrixVisited,
                                       (matrix,
matrixWidth,
                matrixHeight,
                                                 sequenceVisited,
                                  sequences,
             coordSequence, savedSequence, cond,
currReward,
                                                       startIndex,
bufferSize) {
    for (let i = 0; i < sequences.length; i++) {</pre>
        if (sequenceVisited[i] == 0) {
                                      (isSubstring(savedSequence,
sequences[i].sequence)) {
                console.log()
                console.log("-- SELESAI! -- ");
                         currReward = countReward(savedSequence,
sequences);
                console.log("Current reward:", currReward);
                console.log("All coords:", coordSequence);
                console.log("All tokens saved:", savedSequence);
                console.log()
                            isMore (savedSequence, coordSequence,
currReward);
                let currSequenceIndex = i;
                let sequenceVisited copy = [...sequenceVisited];
                sequenceVisited copy[currSequenceIndex] = 1;
                    continueCheckSequence(matrix, matrixVisited,
               matrixHeight,
                              sequences,
                                            sequenceVisited copy,
matrixWidth,
currReward,
             coordSequence, savedSequence, cond,
                                                      startIndex,
bufferSize);
```

```
isMore(savedSequence, coordSequence,
currReward);
               if (savedSequence.length < bufferSize) {</pre>
                                           let seqStartIndex
checkStartIndex(savedSequence, sequences[i].sequence);
seqStartIndex,
                matrixVisited,
                                                  matrixHeight,
sequences, sequences[i].sequence, sequenceVisited, currReward,
coordSequence, savedSequence, bufferSize);
                                cekSatuKolom(matrix, startIndex,
seqStartIndex,
                 matrixVisited, matrixWidth, matrixHeight,
sequences, sequences[i].sequence, sequenceVisited, currReward,
coordSequence, savedSequence, bufferSize);
```

6. Menampilkan hasil

Setelah semua kemungkinan diproses, akan didapatkan sebuah solusi dengan reward terbaik dan dengan kemungkinan sequence terpendek, yang berada di variable global. Timer akan dihentikan dan dicatat, kemudian akan ditampilkan.

```
// Menghentikan timer dan menghitung lama waktu yang
dibutuhkan
    const endTime = performance.now();
    elapsedTime = endTime - startTime;
        console.log("Lama waktu eksekusi: " + elapsedTime + "
milliseconds");
displayResult();
}
```

7. Menyimpan

Terakhir, akan diberikan kesempatan untuk menyimpan ke dalam file (namun dalam kasus ini akan di download filenya, dikarenakan web development tidak memungkinkan save ke local oleh karena masalah keamanan). User dapat memasukkan nama file, dan text yang disimpan sama dengan text yang ditampilkan (beda dengan spesifikasi, dapat dilihat di bab selanjutnya).

```
let fileName = prompt("Enter the filename:", "save.txt");
if (fileName === null) return;

let a = document.createElement('a');
a.href = URL.createObjectURL(blob);
a.download = fileName;
a.click();
}
```
